

One experiment, two connected loops

01 Specify a task

Clip or command + morphology + versioned recipe + seed

02 Studio / API

Validated request → job runner → RLX Studio entry point

03 Collect experience

CPU MuJoCo workers: 61 observations → 14 actions at 50 Hz

04 Learn with PPO

MLX/Metal actor + critic updates; repeat collection and learning

05 Freeze and export

Checkpoint + normalizer sidecar → deterministic ONNX

06 Test independently

Skill gates + controls + full MP4 + physical traces + hashes

Feedback: failed physical tests revise the next experiment, never the acceptance gate.
