

From local learning to a hardware research plan

01 Established here

Nominal CPU MuJoCo + RLX actor: independent simulated skill gates

02 Reproduce first

Match raw observations, action semantics, morphology and checkpoint

03 Proposed robustness study

Matched tests of actuator dynamics, delay, noise and perturbations

04 Official training stack

Port task to mjlabs; retrain with the upstream BAM sim-to-real recipe

05 Separate hardware review

Confirm mechanism, sensing, timing, limits and emergency stop

06 Only then: controlled trials

Qualified supervision + approved safety process + recorded outcomes

This is a proposed progression. No hardware trial is claimed by this book.
